Introduction

This section explores how the City of Roslyn can leverage economic strategies to manage and benefit from the Roslyn Urban Forest effectively.

In 2004, the City of Roslyn acquired 300 acres of primarily Ponderosa pine and Douglas-fir Forest, subsequently named the Roslyn Urban Forest (James Begley, 2008). By 2008, the Citizen Advisory Council had formulated a Land Stewardship Plan (LSP), which was adopted by the city. This plan details the symbiotic relationship between the community and the urban forest, emphasizing two key goals: the development of non-motorized recreational opportunities and the conservation of native forest habitats.

The promotion of non-motorized recreation is expected to attract seasonal recreational tourism, which will not only boost the local economy but also generate funds for ongoing forest conservation and maintenance. Despite the benefits, financing forest maintenance is a contentious issue. Many local residents do not use the forest, yet events like the Jolly Mountain fire in 2017 highlight the considerable environmental and economic risks of neglecting forest management. Currently, forest maintenance is funded through grants from the Department of Natural Resources and city funds, which are used for activities like thinning and controlled burns. The city is managing these challenges as effectively as possible within the constraints of the existing tax structure.

To create a sustainable funding model, this section proposes the introduction of a daily forest pass. Trail users would pay a fixed fee for daily access to the forest, creating a direct funding stream for its upkeep. This initiative not only promises to enhance forest accessibility and

Figure 1 – Map of Roslyn Urban Forest

Economic Benefits of Recreation Tourism (Kam)

Hiking and biking contribute significantly to the economic vitality of rural communities. These activities form a central part of rural tourism, which is essential for promoting economic growth, preserving cultural heritage, and elevating the living standards of local populations (Liu, Chiang, & Ko, 2023; Afjal Hossain & Uchinlayen, 2018). Research indicates that rural tourism acts as a powerful mechanism for economic empowerment in these regions, facilitating development opportunities and fostering collaboration within communities (Nzomo & Muriuki, 2022).

Value Transfer Method Explanation

To derive the economic benefits of hiking and mountain biking tourism, a value transfer method was developed. Value transfer involves taking economic value estimates from one context, usually derived from studies of a particular site or service and applying them to another similar context to predict economic impacts without conducting a full primary study. This technique is commonly used in environmental economics to estimate the benefits or costs associated with environmental goods or services in different locations.

Value Transfer Execution

White and Stynes (2010) conducted a study using data from the U.S. National Visitor Use Monitoring (NVUM) survey, collected from National Forest Service recreation visitors during the federal fiscal years 2005 to 2009. This survey data, which includes detailed expenditure breakdowns for an average visiting party¹ to the Wenatchee-Okanogan National Forest, was

¹ A visiting party in the Wenatchee-Okanogan National Forest is 2 people.

utilized for value transfer. Given the similarities in rural community structure, geographical features, and ecological characteristics, these data were applied to assess the Roslyn Urban Forest.

Similarities between Wenatchee-Okanogan National Forest and Roslyn Urban Forest
• Ecological Characteristics: Both forests are characterized by diverse ecosystems featuring coniferous trees such as Douglas fir, ponderosa pine, and spruce. They provide habitats for a variety of wildlife, including birds, mammals, and insects. • Recreational Opportunities: Each forest offers recreational activities. Hiking, biking, and wildlife viewing are popular in both areas. The Wenatchee-Okanogan National Forest provides more extensive opportunities due to its larger size, including backcountry skiing and camping, while the Roslyn Urban Forest offers more accessible, though less extensive, recreational facilities. • Tourism and Economic Impact: Both contribute to local economies through tourism. Visitors to the Wenatchee-Okanogan National Forest engage in outdoor sports and tourism that support local businesses and communities financially. The Roslyn Urban Forest, while smaller, boosts local tourism by offering a natural escape within an urban setting, appealing particularly to day-trippers and residents.

Figure 2 – Comparing Forests

The analysis indicates that a typical group of two visitors to the City of Roslyn spends on groceries, lodging, recreation and entertainment, dining out, souvenirs, and sporting goods. However, the data from White and Stynes (2010), calculated using 2007 \$USD, does not account for regional purchasing power variations. The geography of Pacific Northwest is characterized by vast landscapes and populated urban areas, the cost of goods in Roslyn, Washington, tends to be

higher due to transportation and distribution expenses. This regional price elevation means that consumers typically pay more for the same quality and quantity of goods compared to other regions.

It is essential to adjust these figures to ensure a more accurate financial assessment. This adjustment involves inflating the values reported by White and Stynes (2010) to reflect current economic conditions and then further adjusting them based on the disparity between the National Consumer Price Index and the Tacoma-Seattle-Bellevue Consumer Price Index. This dual adjustment ensures that the economic analysis reflects both the time lapse since the original study and the specific cost of living in the Roslyn area, providing a more precise understanding of the economic impact of tourism in this region.

Roslyn, WA: Adjusted 2023 Economics Benefits of a Hiking or Mountain Biking Party				
	Non Local (Day Trip)	Non Local (Over Night)	Local (Day Trip)	Local (Over Night)
Groceries	\$10.65	\$127.73	\$7.06	\$75.38
Lodging	\$0.00	\$363.06	\$0.00	\$65.74
Recreation & entertainment	\$2.96	\$31.18	\$0.97	\$2.46
Restaurant	\$28.58	\$189.83	\$9.07	\$54.71
Souvenirs and other expenses	\$5.81	\$46.93	\$1.01	\$11.13
Sporting goods	\$2.34	\$23.29	\$3.09	\$14.98

Table 1 - Base year \$2007, CPI and inflation-adjusted, party = 2 people, data from White and Stynes (2010)

Table 1 provides an outline of the economic impact of hikers and bikers in the City of Roslyn for the year 2023, showing the average spending per party across various categories based on whether visitors are local or non-local and whether they are on a day trip or staying overnight. The data shows that non-locals spending the night spend significantly more across all categories compared to day trippers, reflecting the extended nature of their visit which includes lodging and potentially more meals out. Locals spend the least on day trips and more on overnight stays, though

still less than non-local overnight visitors, suggesting that their familiarity with the area might lead to more economical choices.

Roslyn, WA: Adjusted 2023 Entry Fees for Hiking and Biking Parties		
	Non Local (\$2023)	Local (\$2023)
Day Trip	\$4.74	\$2.80
Over Night Trip	\$20.53	\$12.00

Table 2 - Base year \$2007, CPI and inflation-adjusted, party = 2 people, Data from White and Stynes (2010)

Table 2 presents an estimated average entrance fee that can be expected for the Roslyn Urban Forest, derived from adjusted value transfer based on survey estimates by White and Stynes (2010). This fee approximates users' willingness to pay without directly querying them about their actual willingness. The value transfer method offers the City of Roslyn an initial insight into the benefits and possible fee structures for activities such as hiking and mountain biking. Similar to Table 1, the data indicate that local residents' willingness to pay does not match that of non-residents.

The next section proposes how to utilize these economic assumptions to model the annual economic benefits of hiking and mountain biking, as well as the potential annual income for the city if it were to impose a fee on people wanting to use the Roslyn Urban Forest.

Modeling Economic Benefits

To preface, this section is a proposal. That said, to effectively assess the economic benefits of the Roslyn Urban Forest, it is essential to understand the usage frequency of the forest. Conducting a trail use study is vital for this purpose. A trail use study involves gathering data on the number of people utilizing the trail and providing insights into user patterns and behaviors. We

specifically recommend implementing a trail use study in Roslyn to determine the volume of hikers and mountain bikers.

Conducting a Study on the Frequency and Demographics of Trail Users

The primary goal of this trail use study is to systematically sample usage of the Roslyn Urban Forest across different seasons to gain a detailed perspective on visitor frequency. The study should be divided into two main components:

1. **Usage Study:** This component aims to determine the annual number of visitors to the trail.

By understanding the frequency of human-forest interactions, we can better manage forest resources and plan financially for maintenance and improvements. This straightforward count of visits could be facilitated by simple methods such as installing a counter at the trailhead where visitors press a button upon entry.

2. **Willingness to Pay Study:** This more intensive study should focus on the demographics of the recreators, their origins, frequency of recreation, and expenditure during their visits.

The goal here is to capture a deep understanding of visitors' willingness to pay and their characteristics, aiding in the development of tailored revenue models and management strategies.

The **Usage Study** serves as the foundational layer of the trail use analysis, concentrating exclusively on quantifying the number of visitors to the Roslyn Urban Forest. By employing straightforward data collection methods such as digital counters at trailheads, this study can efficiently gather data on the frequency of trail use. Regular monitoring throughout the year captures seasonal variations in visitor numbers, offering insights into peak and off-peak usage periods. The simplicity of this approach not only facilitates rapid data gathering and processing but also provides essential metrics that inform the management and operational planning for the

forest. This data set, while basic, is crucial for evaluating the overall draw of the forest and setting the stage for more detailed economic analysis.

The **Willingness to Pay Study**, in contrast, delves deeper into the economic dimensions of forest usage by exploring the financial value that visitors place on their recreational experiences. This study focuses on understanding the demographic profiles of visitors, including where they come from, how often they visit, and how much they spend during these visits. Through surveys conducted at various points of entry or online post-visit, the study aims to assess what visitors are truly willing to pay for their experiences in terms of entry fees. This data is vital for developing effective pricing strategies and financial models that can sustain the forest's long-term economic viability. Furthermore, it aids in understanding the broader economic impact of tourism driven by the forest, supporting more informed decision-making for future development and conservation efforts.

The usage study will contribute to frequency and volume of trail visits. The willingness to pay will contribute to the demographic information associated with a recreators maximum willingness to pay for a trail visit. Paired with the economic assumptions in section 2.2, forest managers will be able to model the revenue from a forest access fee. This document provides a write up of a willingness to pay survey for the City of Roslyn (See Appendix A)

Community Engagement (Landen):

As part of this study, understanding the perspectives of Roslyn area residents on the Urban Forest and its impact on tourism was crucial. To gather these insights, on-site interviews with long-term residents were conducted, focusing on their opinions regarding tourism's impacts on the local

community, the significance of the Urban Forest, and the future growth of the city. The findings revealed three main groups of perspectives:

1. **Cautious perception:** a cautious outlook on tourism, citing overcrowding and the pricing out of locals as main concerns. This group expresses significant hesitancy on the growth of the Roslyn area and the use of the Urban Forest by outsiders.
2. **In-between perception:** tourism is a necessary life force for the city's economy but does not come without its problems. This perspective grapples with nuance and embraces complexity. It is recognized that Roslyn needs growth to thrive. Simultaneously, growth is a major concern, for a fear exists that growth has potential to sweep long-time residents and their families out of the community.
3. **Enthusiastic perception:** Roslyn's popularity with tourists has been a favorable experience. This perspective cites the influx of consumers during the spring and summer seasons as being a dominant source of income. This perspective welcomes the visitors of the Urban Forest and sees recreationist as respectful stewards of the environment and community.

Cautious Perception

Further insights emerged from discussions with community members, including business owners and employees. For example, a service industry worker, referred to as "resident X," highlighted the lack of parking during peak seasons as a significant issue. This resident pointed out that the negative sentiments primarily target temporary visitors rather than local residents who frequent the Urban Forest. Resident X also expressed concerns over the rapid growth of Roslyn, fueled by new residents and tourists, which has driven up housing prices, making it increasingly difficult for locals to afford living in their own community. This reflects a broader focus among

residents on the social and economic changes affecting the area, rather than just the environmental aspects of the Urban Forest.

Enthusiastic Perception

"Resident Y," who works in the retail industry, presented a nuanced view on tourism and growth in Roslyn. Their store caters to both locals and tourists, depending heavily on the high-traffic seasons when recreational activities draw visitors to the Urban Forest. As such, Resident Y recognizes tourism as a vital economic force for the region. However, they expressed significant concerns about the increasing difficulty for Roslyn residents to afford housing and goods. Resident Y described Roslyn as overly reliant on a gig economy, lacking the necessary infrastructure to sustain itself as a town. This sentiment was further illustrated by a colleague of Resident Y who, due to rising housing costs, now lives in a mobile home. They also critiqued the expansion of services like Airbnb, which they believe has shifted much of the built infrastructure from residential housing to the lodging industry.

Another major issue highlighted by Resident Y was the traffic congestion during peak seasons, echoing concerns similar to those of Resident X. They supported the idea of increasing shuttle services to nearby Suncadia and Cle Elum to reduce the number of vehicles in Roslyn. Regarding the Roslyn Urban Forest, Resident Y expressed pride in the forest and praised the efforts of local entities like Ridge for securing the forest for the community. However, they shared some reservations about controlled burns, feeling that the burns were not as well-managed as claimed, which sometimes led to greater concerns about their execution.

Resident Y also touched upon forest management as a local industry, noting that family members worked with federal agencies in wildfire prevention during the summer. This

involvement underscores the significant role of forest management in the area, highlighting its importance beyond recreation and emphasizing the Urban Forest's critical impact on the city.

Mixed Perception

"Resident Z," a small business owner in the Souvenir/Crafts industry, holds an overwhelmingly positive view of the changes in the Roslyn area. Having operated their business for 14 years, Resident Z attributes about 90% of their revenue to tourists and "outsiders." They believe that the city needs to adjust its long-term perspective on tourism. Over the past four years, Resident Z has observed a shift in spending patterns in their store. Initially, during the COVID-19 pandemic, relief checks appeared to boost visitor spending, with purchases ranging from \$100 to \$400. More recently, however, they've noticed customers becoming more price-conscious, often spending under \$100.

Resident Z is an ardent supporter of the Roslyn Urban Forest, citing it and the surrounding forest areas as major attractions for visitors and residents alike. They argue that the forest's users are unfairly maligned, noting that most are extremely respectful of the environment. To address concerns about litter from campers and bikers, Resident Z suggests installing larger trash cans or dumpsters. While acknowledging that these might be seen as an eyesore by some, they believe this would be a worthwhile investment to reduce cleanup costs and protect the environment in the long run.

Additionally, Resident Z supports controlled burns for forest management, emphasizing their importance for the long-term health of the Urban Forest. They highlight that controlled burns have historically been used by the Native American population as a protective measure for the

region. It's noteworthy that Resident Z is not a native-born resident of Roslyn, which they admit may influence their more positive view of the region's changes compared to lifelong citizens.

Concluding Stakeholder Remarks

There were businesses focused on outdoor recreation that were closed during the in-person interview period, but anecdotal perspectives from locals provided a general understanding of the role that these serve for visitors looking to utilize the Urban Forest. The willingness to pay survey (See Appendix A) looks to better assess the demographics of the median user of the Urban Forest, but existing research on the market for outdoor recreation on a national level can provide an immediate ballpark estimate for these figures. Data from the 2023 outdoor participation trends report shows that the racial makeup of outdoor recreation is overwhelmingly white (2023 Outdoor Participation and Trends Report, 2023). The national outdoor recreation participation rate has gone up over the years, but the average number of outings has dropped, signifying an increase in “casual” enjoyers of outdoor recreation. However, interviews with residents in Roslyn show that the average recreational tourist in the region is likely more “serious” than the national average; the comparatively secluded geography of the region compared to other locations for outdoor recreational activities lends Roslyn to be less accessible to casual visitors and would support this perception.

Overall, the growing market for outdoor recreation and recent trends in tourism point towards the popularity of the Roslyn Urban Forest continuing to rise. As highlighted by the above interviews, this will be of great concern to the local economy and wellbeing of community members. Solutions recommended include increased shuttle services to reduce traffic induced by tourism, changes in the parking and lodging supply, and improved infrastructure (e.g. signage and waste disposal facilities). Using the Urban Forest as a revenue source will be highly beneficial; if

there is a financial fee to entry into the forest, funds could be used for forest management without affecting the taxpayer funds of Roslyn residents.

Appendix A – Willingness to Pay Write Up (Grant)

Introduction to WTP

Public parks and natural sites serve as invaluable sources of recreation, culture, and tourism across the United States. Trail networks within these sites are frequently sought-after attractions for visitors, offering opportunities for leisurely strolls or challenging hikes, depending on the location. However, despite their significance, these sites are typically funded by taxpayer money, resulting in constrained budgets. Assessing the economic recreational benefits offered by various sections of a recreation site is advantageous for managers seeking to efficiently allocate limited funds for restoration and maintenance at sites. Numerous public natural sites in the United States are accessible free of charge, posing a challenge in assessing their value since visitors do not indicate how much they would be willing to pay for access. In such instances, non-market valuation techniques, which estimate the value of a good in the absence of an economic market, are suitable approaches (Lorber et al, 2021).

Valuation Method

Given this context, the chosen valuation method for this study area is the contingent valuation method (CVM). This approach involves assessing users' willingness to pay for a hypothetical change in the provision level of a non-market good, such as the Rosyln Urban Forest. The contingent market framework defines the good itself, the institutional context in which it

would be provided, and the financing mechanism. Contingent valuation questionnaires are designed to elicit individual preferences in monetary terms.

This questionnaire aims to uncover individuals' estimates of how much having or avoiding the changes in question is worth to them. By expressing preferences in monetary terms, this method determines people's willingness to pay or minimum willingness to accept for various changes of interest. Essentially, a contingent valuation survey is an instrument that presents a series of questions to elicit the monetary value of a change in a non-market good, typically described as hypothetical. The CVM is particularly suitable for cases where individual trails or trail sections are to be valued, as it allows researchers to inquire about visitors' willingness-to-pay (WTP) specifically for the trails they visited.

Generally, this process is broken down into four distinct steps:

1. **Initial Engagement through Attitudinal Questions:** Begin by assessing respondents' attitudes and behaviors concerning the public good being valued. This phase helps prepare respondents for the main valuation questions and identifies key factors influencing their perceptions.
2. **Presentation of the Contingent Scenario:** Introduce a hypothetical scenario detailing the good's characteristics, including its quality, provision reliability, and terms of availability. This also covers logistical aspects and payment methods, setting the stage for eliciting monetary valuations.
3. **Monetary Valuation Queries:** Following the scenario presentation, ask respondents to state their monetary value for the good, assuming they could acquire it under the described conditions. This step is crucial in capturing the economic value respondents assign to the good based on the contingent scenario.

4. **Demographic and Socio-Economic Data Collection:** Conclude by collecting demographic and socio-economic information from respondents. This data helps verify the survey sample's representativeness, compare different questionnaire versions, and explore how demographic factors influence willingness-to-pay.

Furthermore, the payment vehicle is a very important component. There are two types of financing usually used: voluntary and coercive payments. Coercive payments include vehicles such as taxes, rates, fees, charges, or prices. Voluntary payments include donations or gifts. There is a common consensus that voluntary payment vehicles should be avoided due to the generally insurmountable problem of free riding. When choosing a payment vehicle, it must be similar to what would be used in the real world. In this case, a permit is typically what you would find when visiting state and federal parks. For this reason, a permit was chosen instead of a fee or tax.

For this study, we chose to use a double-bounded dichotomous choice model. This means respondents receive not only one question about a required payment but also a follow-up question. The reason for this approach is to obtain more accurate willingness to pay (WTP) estimates from respondents. This method has been shown to improve the statistical efficiency of WTP estimates while narrowing the range in which respondents' true WTP lies. However, some issues include the potential loss of incentive compatibility, as respondents may not view the second question as separate from the first. Additionally, there is an increased possibility of anchoring and yea-saying biases.

Like what was mentioned earlier, CVM is a technique used to evaluate the economic values of non-market goods in a hypothetical market. This method allows analysts to estimate the demand for goods or services that are not directly traded in markets. Socioeconomic characteristics of the respondents, such as gender, age, income, education, and other demographic information, are also

collected. If it can be shown that individuals' preferences are not random but instead vary systematically and are influenced by observable demographic characteristics, then population information can be used to forecast the aggregate WTP for the goods or services evaluated.

The biggest challenge with this method is that talk is cheap, and it is difficult to create a sufficiently detailed and meaningful hypothetical market scenario that respondents can comprehend and understand in relation to the changes or services being valued. This creates issues when this method provides hypothetical answers to hypothetical questions, meaning no real payment is undertaken. As with any empirical methodology, there remain concerns about the validity of the findings of contingent valuation studies, particular in what concerns the measurement of non-use values. Much of the research in this field has sought to construct rigorous tests of the robustness of the methodology across a variety of policy contexts and non-market goods and services. CV has been subject to more stringent testing than any other similar methodology – and has become stronger as a result.

Appendix B – Willingness to Pay Survey (Grant)

Scenario Provided to Survey Taker

The Roslyn Urban Forest (RUF) is a 300 acre nonmotorized forest located in the city of Roslyn, WA situated Cascade Mountains. This type of forest is a mix of Ponderosa pine, Douglas fir, and Grand fir some of which are almost 100 years old. This area is used by a mix of wildlife including deer, elk, bears, owls, and many other animals. Within the board of the RUF there are eight places on the Roslyn Register of Historic Places. The City of Roslyn oversees the Land Stewardship Plan with a couple goals of maintaining a healthy forest ecosystem, provide

nonmotorized recreation, manage fuel loads to reduce risk of fire, protect watershed, and preserve historic and cultural sites.

Currently, there are areas within the RUF that require trail maintenance and improvement to prevent erosion. Additionally, there are dense canopy areas that necessitate expensive thinning due to difficult terrain, making traditional thinning practices impracticable and requiring specialty equipment. This thinning would also reduce the risk of wildfires. Improvements are needed for visitor parking areas and the creation of bathrooms. The goal of the permitting system is to generate a revenue stream to fund these projects while meeting the objectives of the Land Stewardship Plan.

Thank you for agreeing to take part in this 4-5 minute survey measuring the value of the Roslyn Urban Forest. This study is for a Central Washington University research project,

confidentially of your written answers is highly guaranteed. Thank you for your time and cooperation, your input is greatly appreciated.

WTP Survey

1. Have you ever used the Roslyn Urban Forest (RUF) trail network for recreational purposes?

- Yes
- No

2. How often do you use the RUF network for recreational purposes per year?

3. How much time do you spend in the RUF for recreation?

- Less than 1 hr
- 1-2 hrs
- 2-4 hrs
- 4-5 hrs
- If more than 5 hrs, approximately how long do you spend in the RUF?

4. What types of recreational activities do you engage in when using the RUF trail network?

(Select all that apply)

- Hiking
- Wildlife viewing
- Snowshoeing
- Mountain biking
- Photography
- Family/Group outings
- Other (please specify): Education trips, running, etc.

5. How important is the RUF trail network to you?

- Very important
- Somewhat important
- Not very important
- Not at all important

6. If there was an annual permit costing \$2 benefiting the maintenance of the RUF trail network, would you be willing to pay for it? (If "No" go to question 11)

- Yes
- No
- I'm not sure

7. If "Yes" to question 6, would you be willing to purchase a permit for \$5?

- Yes
- No
- I'm not sure

8. If "Yes" to question 7, would you be willing to purchase a permit for \$10?

- Yes
- No
- I'm not sure

9. If "Yes" to question 8, would you be willing to purchase a permit for \$15?

- Yes
- No
- Not sure

10. If "Yes" to question 9, what would you be willing to pay for an annual permit to access the RUF? \$_____

11. For what reason(s) would you not be willing to pay for a permit to visit the RUF?

12. What is your personal annual income?

- Under \$15,000
- \$15,000 – \$29,999
- \$30,000 – \$44,999
- \$45,000 – \$59,999
- \$60,000 - \$74,999
- \$75,000 - \$89,999
- \$90,000 - \$104,999
- \$105,000 - \$119,999
- \$120,000 - \$134,999
- \$135,000 - \$149,999
- \$150,000 - \$164,999
- \$165,000 - \$179,999
- \$180,000 - \$194,999
- \$195,000 - \$209,999
- \$210,000 - \$224,999
- \$225,000 - \$239,999
- \$240,000 - \$254,999
- \$255,000 - \$269,999
- \$270,000 - \$284,999
- \$285,000 - \$299,999
- \$300,000 or above

13. What is the zip code of your primary residence?

14. What is your age? (Please circle one)

- Under 18
- 18-24
- 25-34
- 35-44
- 45-54
- 55-64
- 65+

15. What is your highest level of education?

- Primary or secondary school/high school
- Some college, no degree
- Vocational training/Associate's degree
- Bachelor's degree
- Graduate/Professional degree

16. Do you have a primary residence within the Upper Kittitas Valley?

- Yes
- No

17. If you answered "No" to question 16, do you have a secondary residence in the Upper Kittitas Valley?

- Yes
- No

18. If you answered "No" to question 17, when visiting the RUF trail network, which type of lodging do you use? (If Day Use Only, go to question 19)

- Camping
- Airbnb
- Day Use Only
- Other lodging: _____

19. How many nights do you typically stay when visiting Roslyn?

20. Typically, how much do you spend per night for lodging?

21. When visiting the RUF trail network, do you stop in the town of Roslyn for: (Select all that apply)

- Restaurants
- Shopping
- Do not stop in the town of Roslyn
- Other: _____

22. If you answered "Yes" to stopping in Roslyn, how much do you tend to spend on local amenities when stopping at Roslyn?

- Less than \$10
- \$10.01-\$20.00
- \$20.01-\$30.00
- \$30.01-\$45.00
- \$45.01-\$65.00
- \$65.01-\$100.00
- If more than \$100.00, how much do you spend when visiting Roslyn? _____
